

Organization Sync is Broken

Last Modified on 03/04/2024 9:12 am EST

Problem

When syncing the Organization field between two Service Desk projects in Jira on-premise, the following error occurs:

Error detail:

```
Exalate has problems while trying to create an issue in this Jira.
Details: Error occurred while creating issue. This could be due to a plugin being incompatible with this version of JIRA.
For more details please consult the logs, and see: http://confluence.atlassian.com/x/3McB - com.exalate.basic.domain.
hubobject.v1.BasicHubOrganization cannot be cast to com.atlassian.servicedesk.api.organization.CustomerOrganization
```

Cause

The issue is caused by the fact that Exalate does not convert its own class to the Atlassian class.

Solution

To sync the Organization names between the Service Desk projects, you can add the following Sync rules to the Outgoing and Incoming sync:

Outgoing Sync Rules

```
def getCustomerOrganizations = { _proxyUser, serviceDeskId ->
    com.atlassian.servicedesk.api.organization.OrganizationService orgServ = com.atlassian.jira.component.ComponentAccessor
        .getOSGiComponentInstanceOfType(com.atlassian.servicedesk.api.organization.OrganizationService.class);

    com.atlassian.servicedesk.api.organization.OrganizationsQuery organizationsQuery =
        orgServ.newOrganizationsQueryBuilder()
            .pagedRequest(com.atlassian.servicedesk.api.util.paging.SimplePagedRequest.paged(0, 50))
            .serviceDeskId(serviceDeskId)
            .build();

    Object either = orgServ
        .getOrganizations(_proxyUser, organizationsQuery)
    com.atlassian.servicedesk.api.util.paging.PagedResponse<com.atlassian.servicedesk.api.organization.CustomerOrganization> orgPage = either
        .right()
        .getOrThrow(new com.google.common.base.Supplier<com.exalate.api.exception.IssueTrackerException>() {
            public com.exalate.api.exception.IssueTrackerException get() { return new com.exalate.api.exception.IssueTrackerException("Something failed!"); });

    List<com.atlassian.servicedesk.api.organization.CustomerOrganization> results = com.google.common.collect.Lists.newArrayList();
    results.addAll(orgPage.getResults());

    int limitToKeepTrack = 0;
    while (orgPage.hasNextPage()) {
        limitToKeepTrack += 50;
    }
}
```

```

        limitToKeepTrack += 50;
        organizationsQuery = orgServ.newOrganizationsQueryBuilder()
            .pagedRequest(com.atlassian.servicedesk.api.util.paging.SimplePagedRequest.paged(limitToKeepTrack, limitToKeepTrack + 50))
            .serviceDeskId(serviceDeskId)
            .build();

        orgPage = orgServ.getOrganizations(_proxyUser, organizationsQuery);

        results.addAll(orgPage.getResults())
    }

    return results;
}

def getLocalOrgs = { jIssue ->
    def serviceDeskManagerAdapter = com.atlassian.jira.component.ComponentAccessor.getOSGiComponentInstanceOfType(com.exalate.compatibility.api.IServiceDeskManagerAdapter.class)
    Integer serviceDeskId = serviceDeskManagerAdapter.getServiceDeskIdForProject(jIssue.getProjectObject());
    def proxyUser = com.atlassian.jira.component.ComponentAccessor.getOSGiComponentInstanceOfType(com.exalate.api.node.INodeService.class)
        .proxyUser
    if (serviceDeskId == null) {
        log.error("Service desk is not available for project with id " + jIssue.getProjectId());
        return null;
    }

    return getCustomerOrganizations(proxyUser, serviceDeskId);
}

def toHubOrg = { com.atlassian.servicedesk.api.organization.CustomerOrganization org ->
    new com.exalate.basic.domain.hubobject.v1.BasicHubOrganization(org.name, [])
}

def getOrgs = {
    def customFieldManager = com.atlassian.jira.component.ComponentAccessor.customFieldManager
    def cf = customFieldManager.getCustomFieldObject(issue.customFields.Organizations.id as Long)
    def issueManager = com.atlassian.jira.component.ComponentAccessor.issueManager
    def jIssue = issueManager.getIssueObject(issue.id as Long)
    def localOrgs = getLocalOrgs(jIssue)
    def orgs = localOrgs.collect(toHubOrg)
    orgs
}

replica.customFields.Organizations = issue.customFields.Organizations
replica.customFields.Organizations.value = getOrgs()

```

Incoming Sync Rules

```

def proxyUser = com.atlassian.jira.component.ComponentAccessor.getOSGiComponentInstanceOfType(com.exalate.api.node.INodeService.class)
    .proxyUser
def toCustomerOrganizations = { _proxyUser, serviceDeskId, List<String> valueOrgNames ->
