How to Sync Issue Links on Jira Cloud

This article shows an example of how to synchronize issue links on Jira Cloud.

Configuration

Let's consider you already have the Connection configured between the Instances.

Now you need to **configure issue links synchronization:**

Configure Sync Rules with the scripts provided below:

> **Note**: Add the snippets below to the new line at the end of the existing scripts.

Source Side

Outgoing sync

```
replica.issueLinks = issue.issueLinks
```

Destination Side

Incoming sync

```
issue.issueLinks = replica.issueLinks
```

> **Important**: You should separately synchronize all issues that are linked to a specific issue to keep an association between them on the Destination side.
>
> **Example**:
>
> Sync between projects **DEV** and **TEST**;
>
> issue **DEV-1** is linked to issue **DEV-2**;
>
> sync issue **DEV-1** to **TEST-1**;
>
> *TEST-1 still is not associated with any other issue*
>
> sync issue **DEV-2** to **TEST-2**;
>
> as a result, you get a link between remote issues on the **TEST** project (**TEST-1** and **TEST-2**)
