

qcHelper in HP ALM/QC Helpers

Last Modified on 11/23/2022 10:10 am EST

The qcHelper is an object which can be used in the relation scripts to get specific information from the underlying tracker.

Title	Description
getTestType(qcHelper)	Returns a test case type object, that includes: id, name, description.
getTestPlan(qcHelper)	Returns the ID and name of the parent test folder for test cases.
getStatus (qcHelper)	Returns a hub status with the provided name
getPriority (qcHelper)	Returns a priority with the provided name
getOptions (qcHelper)	Returns a list of all available options for a select list by name
getUserByUsername (qcHelper)	Returns a user matching the specified username or null if user is not found.
findOption (qcHelper)	Returns an option from the specified list of options and its children option. Returns null if an option is not found.
