

Professional Services

Last Modified on 12/21/2023 5:49 am EST

Introduction

System integration is a task that generally requires expert knowledge to set up correctly. Next to the synchronization itself, a good understanding of the underlying tracker technology is essential to do a proper integration project. And the whole project becomes more complicated when 2 or more independent parties are involved (such as when doing a cross-company integration).

Shouldn't the Solution Cover All these Aspects?

Because of the complexity involved, the tooling is only a fraction of what needs to be agreed and implemented. Many aspects need to be considered, such as:

- What information needs to be transferred, at what point in time?
- What is the effect of such transmission?
- What are the allowable values, and the semantic meaning of each field value?
- How are the mappings to be configured, under what condition?
- How to validate and implement the synchronisation?
- What is the size of the information and performance requirements?
- How are the systems monitored, by whom?
- What are the escalation paths whenever something fails?
- What about security, networking, backups, and DR scenarios?

Why Professional Services?

Acquiring the knowledge to do a proper integration, requires a lot of time. While it can be done in-house, it is advisable to outsource this type of project to experts who are dealing with these challenges on a daily basis.

Check out [the partner page](#) for a list.
In case of doubt, contact us at partners@exalate.com

Are there other options besides outsourcing?

We do provide a community site where assistance can be found on a voluntary basis.
