How to Sync Work Items with a Parent Link in Exalate for Azure DevOps

Last Modified on 03/19/2024 11:32 am EDT

In Azure DevOps, parent links are used to break down work items into smaller items, for example, break down features into stories or stories into tasks.

With Exalate, you can create a parent relation by using the parent id of the related work item.

Azure DevOps

Outgoing sync

```
replica.parentId = workItem.parentId
```

Incoming sync

```
if (replica.parentId) {
  def localParent = syncHelper.getLocalIssueKeyFromRemoteId(replica.parentId.toLong())
  if (localParent) {
    workItem.parentId = localParent.id
  }
}
```
