

Exalate for HP ALM/QC: Displaying a remote issue link in a custom field

Last Modified on 04/08/2024 5:01 am EDT

Warning: We are moving Exalate for HP QC/ALM into basic maintenance mode. This transition period will last until November 2024, after which support will be halted completely. For more information, please see <https://exalate.com/blog/end-of-support-hp/>.

This article shows how to synchronize the remote issue link to a custom field on destination instance.

Destination side

1. Add a URL custom field. Let's name it `remotelssueUrl`.

Note: For more information about custom fields, please read Atlassian documentation:

[Adding a custom field](#)

2. Add the code below into the **Incoming sync**:

```
// remotelssueUrl is provided in the incoming sync script  
issue.customFields."Remote issue URL".value = remotelssueUrl
```

Note: "**Remote issue URL**" is the name of the custom field you created in the first step. You can change it to any custom name.
