

How to Sync Select List (single choice) to comment field

Last Modified on 04/10/2024 4:09 am EDT

This article shows how to synchronize a ***select list*** with a ***comment field***.

Exalate allows syncing of any kind of custom field type combination. For example, you have a custom field called **Select List** (select list Single Choice) and you want to add it's value to the comment field on the Destination side.

Sending side

Outgoing sync

```
replica.customFields."Select list custom field name" = issue.customFields."Select list custom field name"
```

Receiving side

Create/Change processors

You can add a new comment including only the select list string value or format the comment with custom formatting. In both cases, use [addComment commentHelper](#) method.

See examples below:

- Add the source side select list custom field value into a new comment

```
1 issue.comments = commentHelper.addComment(replica.customFields."Select list custom field name".value.value, i  
ssue.comments)
```

- Add the source side select list custom field value as a new comment with custom text.

```
1 issue.comments = commentHelper.addComment(  
    "The Select from RED side is: "+ replica.customFields."Select list custom field name".value.value, issue.comments  
)
```
