

How to display a remote issue link in a custom field

Last Modified on 03/27/2025 5:08 pm EDT

This article shows how to synchronize the remote issue link to a custom field on destination instance.

Destination side

1. Add a URL custom field. Let's name it "References".

Note: Check out Atlassian documentation for more information about custom fields: [Adding a custom field](#)

2. Add the code below into the **Incoming sync**

```
1 // We can concatenate the string with the key and the Jira Url(X), remember to update accordingly
2 issue.customFields."References".value = "https://X.atlassian.net/browse/"+replica.key
```

Note: "References" is the name of the custom field, you've created in the first step. You can change it to any custom name.
