

Exalate for Zendesk: how to display a remote issue link in a custom field

Last Modified on 04/08/2024 5:18 am EDT

This article shows how to synchronize the remote issue link to a custom field on destination instance.

Destination side

1. Add a URL custom field. Let's name it `remotelssueUrl` .

Note: For more information about custom fields, please read the Atlassian documentation on [Adding a custom field](#)

2. Add the code below into the **Incoming sync**.

```
// remotelssueUrl is provided in the incoming sync script  
  
issue.customFields."Remote issue URL".value = remotelssueUrl
```

Note: "**Remote issue URL** " is the name of the custom field, you've created in the first step. You can change it to any custom name.
