Adding basic external script

Last Modified on 01/28/2026 10:19 am EST

This article shows an example of how you can create an example groovy file, add a script, and call it in the Sync Rules.

1.

Make sure you have the ***scripts*** directory.

The directory location depends on the issue tracking platform.

Custom scripts can only be deployed on Jira Server/Datacenter and nodes which are deployed through the docker deployment approach.

Platform	location
Jira Server	`<jira-home>/scripts`
Jira Datacenter	`<jira-shared-home>/scripts`
Docker based	`/opt/<nodename>/data/scripts` There could be one of the following values instead of `<nodename>`: ◦ `snownode` for Exalate for ServiceNow. ◦ `adnode` for Exalate for Azure DevOps. ◦ `hpqcnode` for Exalate for HP ALM/QC.
Jira Cloud	Jira Cloud, just as any other cloud node, supports a set of specific scripts. Custom scripts cannot be deployed in this environment. Check out List of external scripts for Jira Cloud for more information.

2.

Create ***BasicFieldSync.groovy*** file with the following code, and store it in the right location on your server. There is no need to restart instance/add-on to enable the external script.

```
class BasicFieldSync
{
 static receive(issue,
     replica,
     nodeHelper,
     commentHelper,
     attachmentHelper) {

   issue.summary      = replica.summary
 issue.description  = replica.description
 issue.assignee     = nodeHelper.getUserByUsername(replica.assignee?.username)
 issue.reporter     = nodeHelper.getUserByUsername(replica.reporter?.username)
 issue.labels       = replica.labels
 issue.comments     = commentHelper.mergeComments(issue, replica)
 issue.attachments  = attachmentHelper.mergeAttachments(issue, replica)
  }
}
```

3.

Call the ***BasicFieldSync.groovy*** script from the Sync Rules

- Replace the script in the outgoing sync rules (create and change processors) as below:

  Existing script

  ```
  issue.summary      = replica.summary
  issue.description  = replica.description
  issue.assignee     = nodeHelper.getUserByUsername(replica.assignee?.username)
  issue.reporter     = nodeHelper.getUserByUsername(replica.reporter?.username)
  issue.labels       = replica.labels
  issue.comments     = commentHelper.mergeComments(issue, replica)
  issue.attachments  = attachmentHelper.mergeAttachments(issue, replica)
  ```

  New script

  ```
  BasicFieldSync.receive(
    issue,
    replica,
    nodeHelper,
    commentHelper,
    attachmentHelper
  )
  ```

Now you have one file with basic synchronization rules. You can reuse it in outgoing sync processors: new issues(create processor) and for existing issues(change processor)

If you add new code into the ***BasicFieldSync.groovy,*** it will be automatically executed in your incoming sync rules (create and change processors).
