

# Adding basic external script

Last Modified on 08/02/2024 5:49 am EDT

This article shows an example of how you can create an example groovy file, add a script, and call it in the Sync Rules.

1.

Make sure you have the *scripts* directory.

The directory location depends on the issue tracking platform.

Custom scripts can only be deployed on Jira Server/Datacenter and nodes which are deployed through the docker deployment approach.

Platform	location
----------	----------

Jira Server	<code>&lt;jira-home&gt;/scripts</code>
-------------	--

Jira Datacenter	<code>&lt;jira-shared-home&gt;/scripts</code>
--------------------	---

	<code>/opt/&lt;nodename&gt;/data/scripts</code>
--	---

There could be one of the following values instead of `<nodename>` :

- |                 |  |
|-----------------|--|
| Docker<br>based | <ul style="list-style-type: none"><li>◦ <code>snownode</code> for Exalate for ServiceNow.</li><li>◦ <code>adnode</code> for Exalate for Azure DevOps.</li><li>◦ <code>hpqcnode</code> for Exalate for HP ALM/QC.</li></ul> |
|-----------------|--|

Jira Cloud	Jira Cloud, just as any other cloud node, supports a set of specific scripts. Custom scripts cannot be deployed in this environment.
------------	--

Check out [List of external scripts for Jira Cloud](#) for more information.

2.

Create ***BasicFieldSync.groovy*** file with the following code, and store it in the right location on your server. There is no need to restart instance/add-on to enable the external script.

```

class BasicFieldSync
{
    static receive(issue,
        replica,
        nodeHelper,
        commentHelper,
        attachmentHelper) {

        issue.summary    = replica.summary
        issue.description = replica.description
        issue.assignee   = nodeHelper.getUserByUsername(replica.assignee?.username)
        issue.reporter   = nodeHelper.getUserByUsername(replica.reporter?.username)
        issue.labels     = replica.labels
        issue.comments   = commentHelper.mergeComments(issue, replica)
        issue.attachments = attachmentHelper.mergeAttachments(issue, replica)
    }
}

```

3.

Call the ***BasicFieldSync.groovy*** script from the Sync Rules

- Replace the script in the outgoing sync rules (create and change processors) as below:

#### Existing script

```

issue.summary    = replica.summary
issue.description = replica.description
issue.assignee   = nodeHelper.getUserByUsername(replica.assignee?.username)
issue.reporter   = nodeHelper.getUserByUsername(replica.reporter?.username)
issue.labels     = replica.labels
issue.comments   = commentHelper.mergeComments(issue, replica)
issue.attachments = attachmentHelper.mergeAttachments(issue, replica)

```

#### New script

```

BasicFieldSync.receive(
    issue,
    replica,
    nodeHelper,
    commentHelper,
    attachmentHelper
)

```

Now you have one file with basic synchronization rules. You can reuse it in outgoing sync processors: [New issues \(create processor\)](#) and [for existing issues \(change processor\)](#)

[Release History](#)

If you add new code into the ***BasicFieldSync.groovy***, it will be automatically executed in your incoming sync rules (create and change processors).
