

Approving Node Import Requests in Exalate

Last Modified on 05/02/2025 8:03 am EDT

When a SyncRoom user requests to import a node, the Exalate administrator needs to approve or decline the request in the **Exalate application**.

Receiving an Import Request

Once a request is sent from SyncRoom, the Exalate administrator will receive a **notification** in the Exalate UI.

To review the request:

1. Open the **Exalate application**.
2. Navigate to the **SyncRoom** tab.
3. Select the **Requests** section.
4. Locate the request, which displays the **username** of the requester and the **network name** where the node is being imported.

The screenshot displays the Exalate application interface. On the left is a sidebar with the Exalate logo and a list of navigation items: company.tracker.com, Getting Started, General Settings, Connections, Entity Sync Status, Triggers, Errors, SyncRoom (highlighted with a blue circle and a '2' badge), Notifications, License Details, Bulk Connect, Sync Queue, and Clean-up Tools. At the bottom of the sidebar is a 'Logout' button. The main content area is titled 'SyncRoom' and has two tabs: 'Networks' and 'Requests' (which is active and highlighted in green with a '2' badge). Below the tabs, there are two request cards. Each card features a user icon, the requester's name, the network they are requesting to add the node to, and a detailed description of the request. At the bottom of each card are 'Deny' and 'Approve' buttons. The first card is for John Doe requesting to add a node to the 'Orlando' network. The second card is for Harry Smith requesting to add a node to the 'Denver' network. At the bottom of the main content area, there are links for 'Documentation', 'EULA', 'Support', and 'Report a bug', followed by the text 'Powered by Exalate v. 5.3.3 (Core v. 5.3.4)'.

Approving or Denying a Request

- Click **Approve** to allow the node to be imported into the specified network.
- Click **Deny** to reject the request.

Important: Once a request is **denied**, the notification will disappear from Exalate. If a request was denied by mistake, a new request must be sent from SyncRoom for approval.

What Happens After Approval?

Once an Exalate admin **approves** a node import request:

- The node is added to the specified **SyncRoom network**.
- Any connections involving this node can now be **managed via SyncRoom**. This includes:
 - Viewing and configuring connection sync rules.
 - Changing connection status.
 - Troubleshooting.
- The access can be revoked from SyncRoom UI at any time.
