How to Sync Multiple Projects in Asana

This article describes how to synchronize tasks assigned to multiple projects in Asana.

Multiple Projects: Asana tasks can belong to multiple projects simultaneously. This enables cross-functional workflows where tasks are tracked across different project contexts.

Incoming sync (Remote system → Asana)

To assign tasks to multiple projects when syncing to Asana, use comma-separated project names:

```
// Single project assignment
entity.customFields.project.value = "Cross-functional project plan"

// Multiple project assignment
entity.customFields.project.value = "Cross-functional project plan,Mars Rover 123"
```

What this does: The connector automatically parses comma-separated project names, resolves them to Asana GIDs, and assigns the task to all valid projects.

Outgoing sync (Asana → Remote system)

To send multiple project information from Asana to the remote system:

```
replica.project = entity.project
```

This provides comprehensive project data including project names, GIDs, and section context in the replica.
