How to Sync Projects in Asana

This article describes how to synchronize projects between Asana and other systems.

Projects in Asana: Projects are collections of tasks that help organize work. They have their own custom fields and track overall progress.

Outgoing sync (Asana → Remote system)

To send project information from Asana to the remote system:

```
replica.key = entity.key
replica.summary = entity.summary
replica.description = entity.description
replica.assignee = entity.assignee  // Project owner
replica.status = entity.status
replica.customFields = entity.customFields
```

Incoming sync (Remote system → Asana)

To receive project information from the remote system and create/update Asana projects:

```
entity.summary = replica.summary
entity.description = replica.description
entity.customFields = replica.customFields
```

Project status handling

To set project completion status:

```
// Mark project as On Track
entity.setStatus("on_track")
```

Template-Based Creation: Projects can be created from templates for complex project structures. See How to Create Projects in Asana for details.
