Manual Synchronization for AzureDevOps Server

Last Modified on 01/15/2026 8:17 pm EST
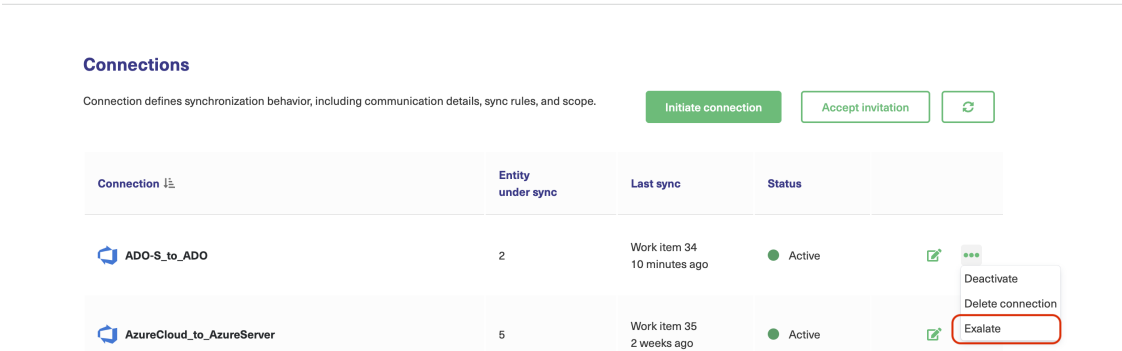

Manual synchronization in Azure DevOps Server can be performed directly from the **Exalate Console**.

Exalate provides two methods to manually synchronize work items in Azure DevOps Server:
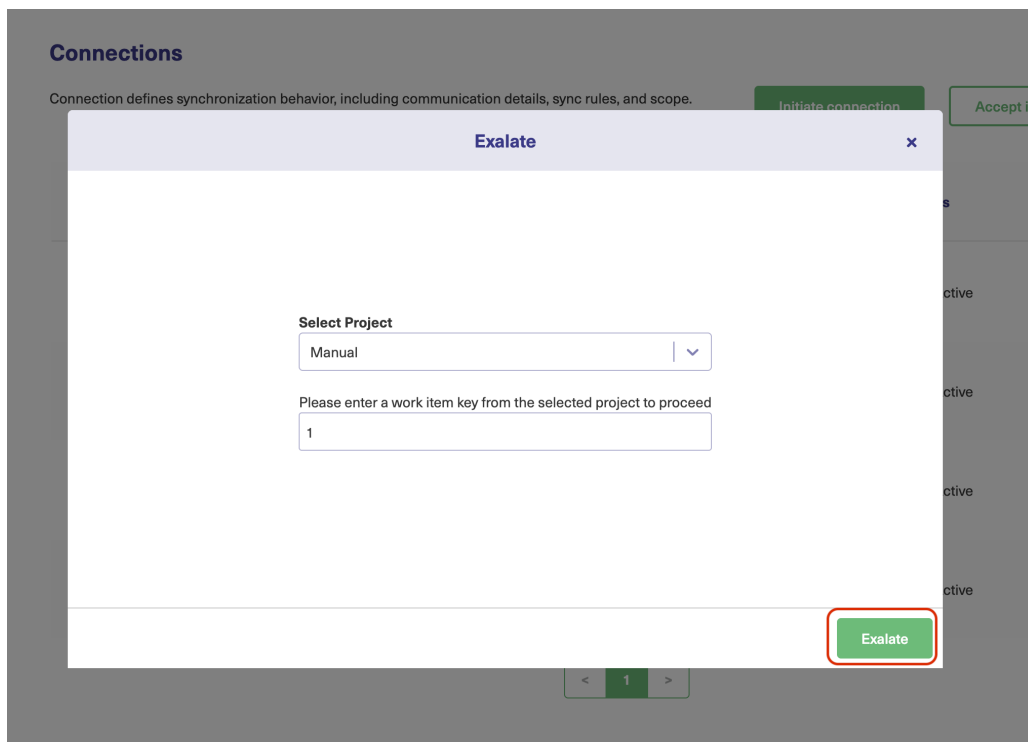

1. Entity Sync Panel – Synchronize work items from the **Entity Sync Panel** in Azure DevOps Server. (Refer to the dedicated section for detailed instructions.)

2. Connections Screen – Initiate synchronization from the **Connections** screen in the Exalate Console.

Synchronizing a Work Item from the Connections Screen

1. Open the **Connections** screen in the **Exalate Console**.

2. Click the **Exalate** button on the desired connection. A popup window appears.

3. Select the target **project**, then enter the **work item key** for the item you want to synchronize.

3. Click **Exalate** to initiate synchronization.

The work item synchronization process starts immediately.

You can monitor the synchronization progress in the **Exalate panel**, and the same status is reflected in the **Entity Sync Status** tab on the **Exalate Admin Panel**.
