

# Install Exalate for Azure DevOps Server

Last Modified on 02/03/2026 5:47 am EST

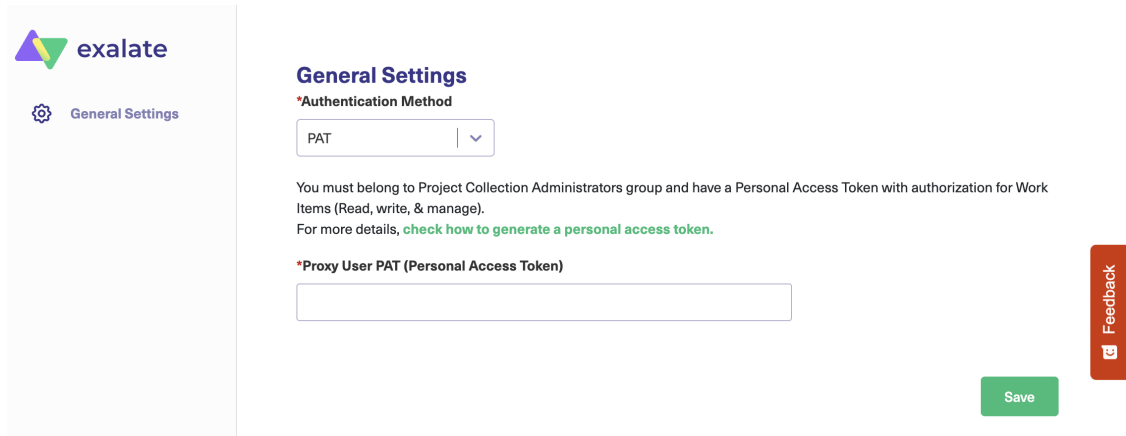

To install **Exalate** for **Azure DevOps Server**, contact the [Exalate team](#).

After receiving your request, the team collects the required configuration details and assigns an **Exalate node** to your Azure DevOps (ADO) Server instance. Once the setup is complete, you will receive the **node URL** at the email address you provided. Use this URL to log in to Exalate for your ADO instance.

## Configuration Steps

### 1. Access the Exalate node

When you access the node for the first time, the **Personal Access Token (PAT)** configuration screen appears.

The screenshot shows the Exalate web interface. On the left is a sidebar with the Exalate logo and a 'General Settings' link. The main content area is titled 'General Settings' and contains the following elements: a section for 'Authentication Method' with a dropdown menu currently set to 'PAT'; a text block stating that the user must belong to the 'Project Collection Administrators' group and have a PAT with 'Read, write, & manage' permissions, with a link to 'check how to generate a personal access token'; a section for '\*Proxy User PAT (Personal Access Token)' with an empty text input field; a green 'Save' button at the bottom right; and a vertical red 'Feedback' button on the far right.

### 2. Add the Personal Access Token (PAT)

Enter the PAT for your ADO Server instance. Refer to [How to Generate PAT in Azure DevOps Server](#) for detailed instructions.

The PAT must have the following permissions for Exalate to function properly:

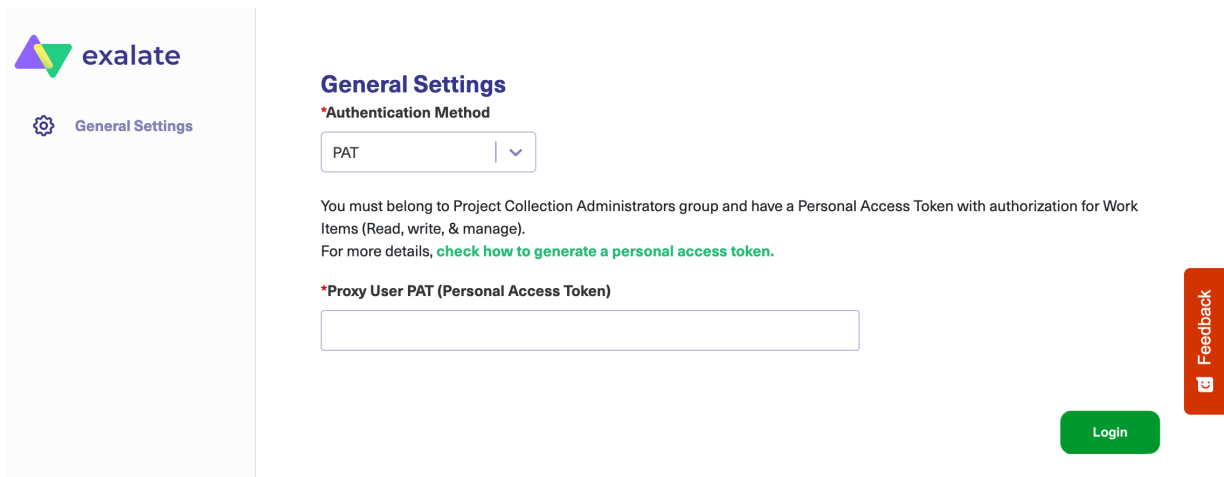

- **Work Items:** Read & Write
- **Project and Team:** Read
- **Identity:** Read (for user mapping)
- **Code:** Read (if synchronizing repository links)

### 3. Save the configuration

Click **Save** to link your Azure DevOps instance with the assigned Exalate node.

### 4. Authenticate with the PAT

After saving, a login screen appears. Re-enter your PAT and click **Login** to complete authentication.

The screenshot shows the 'General Settings' page for Exalate. On the left is a sidebar with the Exalate logo and a 'General Settings' link. The main content area is titled 'General Settings' and contains an 'Authentication Method' dropdown menu currently set to 'PAT'. Below this, a message states: 'You must belong to Project Collection Administrators group and have a Personal Access Token with authorization for Work Items (Read, write, & manage). For more details, [check how to generate a personal access token.](#)' There is a text input field for 'Proxy User PAT (Personal Access Token)'. At the bottom right is a green 'Login' button. A vertical orange 'Feedback' button is on the far right.

5. You can now start using **Exalate** to synchronize data between your Azure DevOps Server instance and other connected platforms.
