How to Sync between Select List (single choice) and user picker custom field

Last Modified on 01/28/2026 7:10 am EST

This article shows how to synchronize a *select list* with a *user picker field.*

Exalate allows syncing any kind of custom field type combination. For example, you have a custom field called **userlist** (select list Single Choice) to the custom field **Escalated to** (user picker field).

Sending side

Outgoing sync

```
1 #
2 # Include the customfield 'usersList' in the message sent to the receiving instance
3 #
4 replica.customFields."usersList" = issue.customFields."usersList"
5 ...
```

Receiving side

Incoming sync

```
1 #
2 # The replica.customFields."usersList".value is an object of type option.
3 # The option contains a value, which is the string of the option.
4 # issue.customFields."Escalated to".value is a user picker type custom field, which includes string value
5 #
6 issue.customFields."Escalated to".value = nodeHelper.getUserByUsername(replica.customFields."usersList"?.value.value)
7
8 ...
```
