

# Can I run New Exalate and Classic at the same time?

Last Modified on 02/03/2026 7:58 am EST

Yes, you can run both New Exalate and Classic simultaneously during your transition period. This parallel operation allows organizations to maintain existing production integrations in Classic while testing and configuring new connections in the unified console. Teams can evaluate the new experience, train users on updated features, and validate configurations without disrupting current operational integrations.

## Why run both during transition

Running both versions enables phased migration strategies where you move connections incrementally rather than all at once. Organizations can start with less critical integrations to build confidence with the new interface, Aida AI assistance, and Test Run functionality before transitioning business-critical synchronizations. This approach reduces risk and allows teams to develop expertise gradually.

## Importing connections from Classic

When you import existing connections from Classic into the new console, you can choose which integrations to migrate and when. Connections not yet imported continue operating normally in Classic with full support maintained for both experiences during the transition. Your subscription and licensing accommodate this dual operation period, ensuring no interruption to service.

## What stays the same (scripting, concepts, support)

The same scripting logic and sync patterns work across both environments, so knowledge gained while using Classic applies directly to the new experience. Teams familiar with Groovy scripting, replica concepts, and helper functions can leverage that expertise immediately when working in the unified console. Support is available for both versions to assist with migration planning and any technical questions during the transition.
