

# Sync Select List (single choice) to comment field

Last Modified on 02/11/2026 9:29 am EST

This article shows how to synchronize a **select list** with a **comment field**.

Exalate allows syncing any kind of custom field type combination. For example, you have a custom field called **Select List** (select list Single Choice) and you want to add its value to the comment field on the Destination side.

## Sending side

### Outgoing sync

```
1 replica.customFields."Select list custom field name" = issue.customFields."Select list custom field name"
```

## Receiving side

### Create/Change processors

You can add a new comment including only the select list string value or format the comment with custom formatting. In both cases, use the [addComment commentHelper](#) method.

Check examples below:

- Add the source side select list custom field value into a new comment

```
1 issue.comments = commentHelper.addComment(replica.customFields."Select list custom field name".value.value, issue.comments)
```

- Add the source side select list custom field value as a new comment with custom text

```
1 issue.comments = commentHelper.addComment(  
2   "The Select from RED side is: "+ replica.customFields."Select list custom field name".value.value, issue.comments)  
3 )
```
